
Edit Fonts Activity Documentation

Release 1.0

Yash Agarwal

August 21, 2016

1	Objects	3
1.1	BaseFont	3
1.1.1	Tasks	3
1.2	BezierPenTool	3
1.2.1	Tasks	3
2	Indices and tables	5
	Python Module Index	7

Typeface design is a cornerstone of literate cultures, with subliminal power: Typefaces carry the emotions of texts, from formal designs that speak with authority to fun designs that are silly or military or ornate. They are both artistic and functional works, and our ability to share and modify them is important for the same reasons as for software programs.

Sugar is a learning platform that reinvents how computers are used for education. Collaboration, reflection, and discovery are integrated directly into the user interface, and “studio thinking” and “reflective practice” are promoted through Sugar’s clarity of design. Sugar was initially developed by Red Hat and Pentagram with One Laptop per Child, and today is developed by the Sugar Labs community. It now has over 1M users, including every child in Uruguay.

Fonts are fun to make, and Sugar needs a font editor activity so learners can make and modify them for their own tastes and needs.

1.1 BaseFont

See also:

globals: the globals class contains a BaseFont object

1.1.1 Tasks

Create Font

- `new_standard_font()`

Create Glyph

- `new_standard_glyph()`

BaseFont

1.2 BezierPenTool

See also:

EditorBox: the Editor Box controls the state of the Bezier Pen Tool

1.2.1 Tasks

- `distance()`

Create Glyph

BaseFont

Indices and tables

- `genindex`
- `modindex`
- `search`

e

`editfonts.objects.basefont`, 3
`editfonts.objects.bezierpen`, 3
